"Identification of human cadherin-14, a novel neurally specific type
II cadherin, by protein interaction cloning.";
J. Biol. Chem. 272:5236-5240(1997),
-I- FUNCTION: CADHERINS ARE CALCIUM DEPENDENT CELL ADHESION PROTEINS.
THEY PREFERENTIALLY INTERACT WITH THEMSELVES IN A HOMOPHILIC
MANNER IN CONNECTING CELLS; CADHERINS MAY THUS CONTRIBUTE TO THE
SORTING OF HETEROCENEOUS CELL TYPES.
-I- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
-I- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PS Disclosure; Column 4; 42pp; English.

CC The patent describes a new preparation of microparticles each CC comprising a polymeric matrix and a nucleic acid. The polymeric CC matrix consists of one or more synthetic polymers having a solubility CC in water of less than 1 mg/l (e.g. poly-lactic-co-glycolic acid);

CC and at least 90% of the microparticles have a diameter of less than CC 100 microns. The microparticles are useful for the delivery of nucleic acids to phagocytic cells. In one embodiment the microparticles are cells to phagocytic cells. In one embodiment the microparticles are colored circular form) includes an expression control sequence CC coperatively linked to a coding sequence, where the expression product CC of the coding sequence is a polypeptide having a length and a sequence CC which permits it to bind to an MHC class I or I molecule. The cepression product is thus an effective stimulator of an immune CC expression by the nucleic acid. It is associated with pemphigus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Ma

CR Also described is a MP of at most 20 microns in diameter, comprising: (a) a PM; and (b) a NAM comprising an expression control sequence operatively clinked to a coding sequence, where the coding sequence encodes an correct expression product selected from: (l) a polypeptide at least 7 amino conditions and the sequence of: (l) a class in length, having a sequence identical to the sequence of: (l) a fragment of a naturally-occurring mammalian protein; or (ii) a fragment correct in a naturally-occurring mammalian protein; or (ii) a fragment correct in a mammal; (2) a peptide having a length and sequence which infects correct to an MRC class I or II molecule; and (3) the polypeptide or the CC bind to an MRC class I or II molecule; and (3) the polypeptide or the correct into phagocytic cells. They can be used for gene therapy, e.g. for the antimer presence.

CC to preating genetic diseases, infections or tumours or for downregulating correct corrections.

W07908 represents the human pemphigus vulgaris (PV) antigen extracellular region. The PV antigen is produced in patients wit pemphis vulgaris resulting in autoimmune disease. PV is a rare relapsing disease causing suprabasal, interpolermal bullae (vesicles) of the skin and mucuous membranes, which is fatal if untreated. The PV antigen was fused to a human IgG1 hinge region and the resulting fusion protein is useful to treat or diagnose

                                                                                                                                                                                                                                                                                                                                                                    remphigus follaceus antigen-IgG constant region fusion protein - linked through the hinge region used to treat pemphigus follaceus Claim 1; Page 10-12; 17pp; Japanese.
Claim 1; Page 10-12; 17pp; Japanese.
Claim 1; Page 10-12; 17pp; Japanese.
Constant to the extracellular recognised by pemphigus foliaceus patient autoantibody which comprises the constant region of IgG linked to the extracellular region. Pemphigus foliaceus is antigen protein through the hinge portion. Pemphigus foliaceus is a chronic, generalised, vesicular and scaling skin eruption similar to dermatitis herpetiformis. The pemphigus foliaceus antigen fusion protein is useful to treat pemphigus follaceus. The antigen is especially administered through an adsorbent upon which the fusion protein is immobilised via a carrier. The fusion protein is also useful for detecting pemphigus follaceus antibodies which is useful in immunodiagnosis. The fusion protein has little or no side effects.
                                                                                                                                                                                                                                         Query Ma

PT surface of epithelial or carcinoma cells, not bound to desmosomes, experiment for diagnosis and treatment of carcinoma micrometastases.

PT useful for diagnosis and treatment of the desmosomal cadherin (DC), carcinoma cells and not bound to desmosomes.

PS Claim 7; Page 5; Bpp; German.

CC The present sequence is a segment of the surface of epithelial or carcinoma cells and not bound to desmosomes. An antibody (Ab)

CC desmoglein Dsg2, which is exposed on the surface of epithelial or carcinoma cells and not bound to desmosomes. An antibody (Ab)

CC diagnose, i.e. to detect carcinoma cells, especially

CC diagnose, i.e. to detect carcinoma cells, especially

CC diagnose, i.e. to detect carcinoma cells by cell sorting methods and care to liver agents, e.g. other Ab or toxins, to compare the cells. The Ab provides rapid and reliable detection of metastatic carcinoma, and detects parts of DC that are not more and tissue or carcinoma cells. Basin normal tissue or

PR Antibody reactive with part of desmosomal cadherin - exposed on PT surface of epithelial or carcinoma cells, not bound to desmosomes, PT useful for diagnosis and treatment of carcinoma micrometastases PS Claim 9; Page 5; Bpp; German.
CC The present sequence is a segment of the desmosomal cadherin (DC).
CC desmoglein Dag2, which is exposed on the surface of epithelial or CC diagnose, i.e. to detect carcinoma cells, especially
CC discreted against epitopes of the present sequence can be used to CC diagnose, i.e. to detect carcinoma cells, especially
CC micrometastases, not bound to desmosomes, to separate, enrich or CC detect living or fixed carcinoma cells, especially
CC micrometastases, not bound to desmosomes, to separate cells. The Ab provides rapid and reliable detection of CC arcessible in desmosome bound cells, as in normal tissue or

PT develop prods. for diagnosis, prognosis, therapy and prophylaxis of t-cadherin disorders, e.g. mallgnancies

PT develop prods. for diagnosis, prognosis, that is also known as claim 1: page 59-63; 97pp; English.

CE treadherin is a cell adhesion molecule that is also known as claim 1: page 59-63; 97pp; English.

CE treadherin is a colonic epithelia cell CNA ilbrary. The following sequences and a colonic epithelial cell CNA ilbrary. The following components and a colonic epithelial cell CNA ilbrary. The following sequences are specifically claimed: AAs 1-878; 151-878; 30

CE sequences are specifically claimed: AAs 1-878; 151-878; 30

                                                                                                           Recombinantly-generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of order Mononegavirales - having attenuating mutation in 3' genomic promoter region and RNA polymerase gene, useful as vaccine to immunise against such virus Disclosure; Page 246-254; 426pp; English.

This sequence represents the wild-type L protein from Human parainfluenza virus (HPIV-3) type 3 isolate JS. This sequence is used in a method which involves the isolation of recombinantly-generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of the order Mononegavirales which have at least 1 attenuating mutation in the 3' mononegavirales which have at least 1 attenuating mutation in the 3'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The human E-cadherin protein precursor (R85487) is expressed by an cDNA clone (T05764) derived from human liver. The extracellular domain of E-cadherin is used to generate peptides that specifically bind to heterotypic cognates of E-cadherin and which inhibit adhesion of intra-epithelial T-lymphocytes to E-cadherin-expressing epithelial or endothelial cells in vitro or in vivo, thereby modulating mucosal immune responses. Such peptides are also specifically reactive with a monoclonal antibody (E4.6 or E6.1) that binds to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (BGHM ) BRIGHAM & WOMENS HOSPITAL Brenner MB, Cepek KL; WPI; 95-92921/50.
genomic promoter region and at least
polymerase gene. This RNA virus can b
individual against such a virus.

This sequence is used in a method which involves the isolation of recombinantly generated, attenuated, involves the isolation of recombinantly generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of the order wononegavirales which have at least 1 attenuating mutation in the 3' genomic promoter region and at least 1 attenuating mutation in the RNA polymerase gene. This RNA virus can be used as a vaccine to immunise an individual against such a virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

Recombinantly-generated, attenuated, non-segmented negative-sense, single stranded RNA virus of order Mononegavirales - having attenuating mutation in 3' genomic promoter region and RNA polymerase gene, useful as vaccine to immunise against such virus plsclosure; Page 265-273; 426pp; English.

This sequence represents the Human parainfluenza virus (HPIV-3) type vaccine FRAI cp45 L protein. This sequence is used in a method which involves the isolation of recombinantly generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of the order
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          W48712 standard; Protein: 2233 AA.

Myrothecium verrucaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       HUCEP-1 protein having neuron function activating activity -
for treating ischaemic brain diseases and nerve denaturation
conditions such as Parkinson's and Alzheimer's diseases
Claim 1; Fig 4; 17pp; Japanese.
The present sequence represents human cerebral protein-1 (HUCEP-1 has neuron function activating activity. HUCEP-1 is ufor treating ischaemic brain diseases and nerve denaturation
conditions such as Parkinson's and Alzheimer's diseases.
Sequence 456 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       24-FEB-1994 (first Bilirubin oxidase.
                                                                                                                                                                                                                                                                                                                J05199882-A.

Release 3.1A John F. Collins, Biocomputing Research Unit. Copyright (c) 1993-1998 University of Edinburgh, U.K. Distribution rights by Oxford Molecular Ltd

Run on: MPsrch_pp protein - protein database search, using Smith-Waterman algorithm Sat May 13 07:10:21 2000; MasPar time 4.28 Seconds 165.192 Million cell updates/sec

Sequence: Description: Perfect Score: >US-08-991-628-3 (1-15) from US08991628.pep 96 1 LNSKIAFKIVSQEPA 15

Tabular output not generated.

Scoring table: PAM 150 Gap 15

Searched: 142080 segs, 47172406 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

pir62 1:pirl 2:pir2 3:pir3 4:pir4

Database:

Statistics: Mean 25.750; Variance 32.305; scale 0.797

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
